

**Midterm Exam**  
**"Fundamentals of modern optics"**  
**WS 2014/15**  
**solution examples**

**Problem 1 – Maxwell's equations**

**3 + 2 + 3 + 1 = 9 points**

1. Write down Maxwell's equations and the auxiliary fields **D** and **H** in time domain.

Maxwell's equations:

$$\begin{aligned}\nabla \times \mathbf{E}(\mathbf{r}, t) &= -\frac{\partial \mathbf{B}(\mathbf{r}, t)}{\partial t} \\ \nabla \times \mathbf{H}(\mathbf{r}, t) &= \mathbf{j}(\mathbf{r}, t) + \frac{\partial \mathbf{D}(\mathbf{r}, t)}{\partial t} \\ \nabla \cdot \mathbf{D}(\mathbf{r}, t) &= \rho(\mathbf{r}, t) \\ \nabla \cdot \mathbf{B}(\mathbf{r}, t) &= 0\end{aligned}$$

constitutive equations:

$$\begin{aligned}\mathbf{D}(\mathbf{r}, t) &= \epsilon_0 \mathbf{E}(\mathbf{r}, t) + \mathbf{P}(\mathbf{r}, t) = \epsilon_0 \int_{-\infty}^{+\infty} \epsilon(\mathbf{r}, t - \tau) \mathbf{E}(\mathbf{r}, \tau) d\tau \\ \mathbf{H}(\mathbf{r}, t) &= \frac{1}{\mu_0} \mathbf{B}(\mathbf{r}, t)\end{aligned}$$

2. Write down Maxwell's equations in frequency domain in a linear, homogeneous and isotropic dielectric medium in absence of free charges and current density ( $\rho = 0$  and  $\mathbf{j} = 0$ ).

$$\begin{aligned}\nabla \times \mathbf{E}(\mathbf{r}, \omega) &= i\omega\mu_0 \mathbf{H}(\mathbf{r}, \omega) \\ \nabla \times \mathbf{H}(\mathbf{r}, \omega) &= -i\omega \mathbf{D}(\mathbf{r}, \omega) \\ \nabla \cdot \mathbf{D} &= 0 \\ \nabla \cdot \mathbf{H} &= 0\end{aligned}$$

3. Derive the wave equation in Fourier domain for the electric field in a linear, homogeneous and isotropic dielectric medium in absence of free charges and current density ( $\rho = 0$  and  $\mathbf{j} = 0$ ).

From Maxwell's equations:

$$\begin{aligned}\nabla \times \nabla \times \mathbf{E}(\mathbf{r}, \omega) &= i\omega\mu_0 \nabla \times \mathbf{H}(\mathbf{r}, \omega) \\ &= i\omega\mu_0 (-i\omega \mathbf{D}(\mathbf{r}, \omega)) \\ &= \mu_0 \omega^2 \mathbf{D}(\mathbf{r}, \omega) \\ &= \mu_0 \epsilon_0 \omega^2 \mathbf{E}(\mathbf{r}, \omega) + \mu_0 \omega^2 \mathbf{P}(\mathbf{r}, \omega) \\ &= \frac{\omega^2}{c^2} \epsilon(\mathbf{r}, \omega) \mathbf{E}(\mathbf{r}, \omega)\end{aligned}$$

and with:

$$\begin{aligned}\nabla \times \nabla \times \mathbf{E}(\mathbf{r}, \omega) &= \mathbf{grad} \operatorname{div} \mathbf{E}(\mathbf{r}, \omega) - \Delta \mathbf{E}(\mathbf{r}, \omega) \\ &= -\Delta \mathbf{E}(\mathbf{r}, \omega)\end{aligned}$$

we can find:

$$\Delta \mathbf{E}(\mathbf{r}, \omega) + \frac{\omega^2}{c^2} \epsilon(\mathbf{r}, \omega) \mathbf{E}(\mathbf{r}, \omega) = 0$$

4. Give the formula of the time averaged Poynting vector.

$$\text{Time averaged Poynting vector: } \langle \mathbf{S}(\mathbf{r}, t) \rangle = \frac{1}{2} \text{Re} (\mathbf{E}(\mathbf{r}) \times \mathbf{H}^*(\mathbf{r}))$$

**Problem 2 – Poynting Vector and Normal Mode**

**2 + 2 + 1 + 3 = 8 points**

a) First represent the real valued electric field in its complex form, to identify the wave-vector:

$$\mathbf{E}_r(\mathbf{r}, t) = E_0 \mathbf{e}_x e^{-\alpha z} \cos(\beta z - \omega t + \phi) = \frac{1}{2} [\mathbf{E}_c e^{-i\omega t} + \mathbf{E}_c^* e^{+i\omega t}]$$

with  $\mathbf{E}_c = E_0 e^{i\phi} \mathbf{e}_x e^{i(\beta+i\alpha)z}$ . We identify the wave-vector as  $\mathbf{k} = \mathbf{k}' + i\mathbf{k}'' = (\beta + i\alpha) \mathbf{e}_z$ . We know the dispersion relation of a plane wave in a homogeneous medium as  $\mathbf{k} \cdot \mathbf{k} = \frac{\omega^2}{c^2} \epsilon$ . Expanding both sides gives us:

$$k'^2 - k''^2 = \frac{\omega^2}{c^2} \epsilon' \quad , \quad 2k'k'' = \frac{\omega^2}{c^2} \epsilon''$$

From which we find  $k' \approx \frac{\omega}{c} \sqrt{\epsilon'}$  and  $k'' \approx \frac{\omega}{c} \frac{\epsilon''}{2\sqrt{\epsilon'}}$ .

b) Same like electric field, we can present the real valued magnetic field like:

$$\mathbf{H}_r(\mathbf{r}, t) = \frac{1}{2} [\mathbf{H}_c e^{-i\omega t} + \mathbf{H}_c^* e^{+i\omega t}]$$

Using the time domain Maxwell equation  $\nabla \times \mathbf{E}_r = -\mu_0 \frac{\partial \mathbf{H}_r}{\partial t}$ , we find the relation between the complex amplitudes to be  $\nabla \times \mathbf{E}_c = i\omega\mu_0 \mathbf{H}_c$ . Followed by:

$$\nabla \times \mathbf{E}_c = \begin{vmatrix} \mathbf{e}_x & \mathbf{e}_y & \mathbf{e}_z \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ E_0 e^{i\phi} \mathbf{e}_x e^{i(\beta+i\alpha)z} & 0 & 0 \end{vmatrix} = i(\beta + i\alpha) E_0 e^{i\phi} \mathbf{e}_y e^{i(\beta+i\alpha)z}$$

Which gives  $\mathbf{H}_c = \frac{(\beta+i\alpha)E_0 e^{i\phi}}{\omega\mu_0} \mathbf{e}_y e^{i(\beta+i\alpha)z}$ . And we calculate the real valued magnetic field:

$$\mathbf{H}_r = \frac{E_0 e^{-\alpha z}}{2\omega\mu_0} \mathbf{e}_y \left[ (\beta + i\alpha) e^{i(\beta z - \omega t + \phi)} + (\beta - i\alpha) e^{-i(\beta z - \omega t + \phi)} \right] = \frac{E_0}{\omega\mu_0} e^{-\alpha z} \mathbf{e}_y [\beta \cos(\beta z - \omega t + \phi) - \alpha \sin(\beta z - \omega t + \phi)]$$

c)  $\mathbf{S}_r(\mathbf{r}, t) = \mathbf{E}_r(\mathbf{r}, t) \times \mathbf{H}_r(\mathbf{r}, t)$

d)

$$\begin{aligned} \langle \mathbf{S}_r(\mathbf{r}, t) \rangle &= \lim_{T \rightarrow \infty} \frac{1}{2T} \int_{-T}^{+T} \mathbf{S}_r(\mathbf{r}, t) dt \\ &= \lim_{T \rightarrow \infty} \frac{1}{2T} \int_{-T}^{+T} \mathbf{E}_r(\mathbf{r}, t) \times \mathbf{H}_r(\mathbf{r}, t) dt \\ &= \frac{E_0^2}{\omega\mu_0} e^{-2\alpha z} \mathbf{e}_z \lim_{T \rightarrow \infty} \frac{1}{2T} \int_{-T}^{+T} \cos(\beta z - \omega t + \phi) [\beta \cos(\beta z - \omega t + \phi) - \alpha \sin(\beta z - \omega t + \phi)] dt \\ &= \frac{E_0^2}{\omega\mu_0} e^{-2\alpha z} \mathbf{e}_z \lim_{T \rightarrow \infty} \frac{1}{2T} \int_{-T}^{+T} \left[ \beta \frac{\cos(2(\beta z - \omega t + \phi)) + 1}{2} - \alpha \frac{\sin(2(\beta z - \omega t + \phi))}{2} \right] dt \\ &= \frac{E_0^2}{\omega\mu_0} \frac{\beta}{2} e^{-2\alpha z} \mathbf{e}_z \end{aligned}$$

**Problem 3 – Beam propagation (Imaging)**
**3 + 3 + 3 = 9 points**

$$\begin{aligned}
 \text{a) } U_0(\alpha, \beta; z=0) &= \frac{1}{(2\pi)^2} \int_{\mathbb{R}^2} A \exp \left( -i\pi \frac{x^2 + y^2}{\lambda f} - i(x\alpha + y\beta) \right) dx dy \\
 &= \frac{A}{(2\pi)^2} e^{\frac{i(\alpha^2 + \beta^2)\lambda f}{4\pi}} \int_{\mathbb{R}^2} \exp \left( \frac{-i\pi}{\lambda f} \left( \underbrace{x^2 + 2 \frac{\lambda f \alpha}{2\pi} x + \left( \frac{\lambda f \alpha}{2\pi} \right)^2}_{=x'^2} + \underbrace{y^2 + 2 \frac{\lambda f \beta}{2\pi} y - \left( \frac{\lambda f \beta}{2\pi} \right)^2}_{=y'^2} \right) \right) dx dy \\
 &= \frac{A}{(2\pi)^2} e^{\frac{i(\alpha^2 + \beta^2)\lambda f}{4\pi}} \int_{\mathbb{R}^2} \exp \left( \frac{-i\pi}{\lambda f} \underbrace{(x'^2 + y'^2)}_{\rho^2} \right) dx' dy' \\
 &= \frac{A}{(2\pi)^2} e^{\frac{i(\alpha^2 + \beta^2)\lambda f}{4\pi}} \int_0^\infty \int_0^{2\pi} \exp \left( \frac{-i\pi}{\lambda f} \rho^2 \right) \rho d\phi d\rho = \frac{A}{2\pi} e^{\frac{i(\alpha^2 + \beta^2)\lambda f}{4\pi}} \int_0^\infty \exp \left( \frac{-i\pi}{\lambda f} \rho^2 \right) \rho d\rho \\
 &= -\frac{iA\lambda f}{4\pi^2} \exp \left( i \frac{(\alpha^2 + \beta^2)\lambda f}{4\pi} \right) = -\frac{iA\lambda f}{4\pi^2} \exp \left( i \frac{k_\rho^2 \lambda f}{4\pi} \right)
 \end{aligned}$$

where  $k_\rho^2 = \alpha^2 + \beta^2$

b) Free space transfer function:

$$H_F(k_\rho; z) = \exp(ik_z z) = \exp \left( iz \sqrt{k_0^2 - k_\rho^2} \right) = \underbrace{\exp \left( iz k_0 \left( 1 - \frac{k_\rho^2}{2k_0^2} \right) \right)}_{\text{paraxial } \Rightarrow k_\rho/k_0 \ll 1} = \exp \left( iz k_0 - iz \frac{k_\rho^2 \lambda}{4\pi} \right)$$

$$H_F(\alpha, \beta; z) = \exp \left( iz k_0 - iz(\alpha^2 + \beta^2)\lambda/4\pi \right)$$

$\Rightarrow$  Evanescent waves:  $k_\rho > k_0$

$\Rightarrow$  Propagating waves:  $k_\rho \leq k_0$

$$\begin{aligned}
 \text{c) } U(\alpha, \beta; z=f) &= U_0(\alpha, \beta; z=0) H_F(\alpha, \beta; f) \\
 &= -\frac{iA\lambda f}{4\pi^2} \exp \left( i \frac{k_\rho^2 \lambda f}{4\pi} \right) \exp \left( ik_0 f - i \frac{k_\rho^2 \lambda f}{4\pi} \right) \\
 &= -\frac{iA\lambda f}{4\pi^2} e^{ik_0 f} \\
 u(x, y, z=f) &= \int_{\mathbb{R}^2} U(\alpha, \beta; z=f) e^{i(x\alpha + y\beta)} d\alpha d\beta \\
 &= -\frac{iA\lambda f}{4\pi^2} e^{ik_0 f} \int_{\mathbb{R}^2} e^{i(x\alpha + y\beta)} d\alpha d\beta \\
 &= -\frac{iA\lambda f}{4\pi^2} e^{ik_0 f} \delta(x) \delta(y)
 \end{aligned}$$

**Problem 4 - Gaussian beam in a telescope (2+2+2 points)**

1. The  $q$  parameter at the first lens is given by  $q = f_1 + iz_0$ . Using the ABCD formalism, we obtain the parameter  $q'$  of the beam just after the lens:

$$q' = \frac{f_1 + iz_0}{-\frac{1}{f_1}(f_1 + iz_0) + 1} = \frac{f_1 + iz_0}{-\frac{iz_0}{f_1}} = -f_1 + i \frac{f_1^2}{z_0}$$

that means that the waist position is at  $z = f_1$  after the lens and the new Rayleigh range is:  $z'_0 = \frac{f_1^2}{z_0}$ .

2. The propagation of the Gaussian beam over a distance of  $d = f_1 + f_2$  leads to a parameter  $q'' = f_2 + iz'_0$  just in front of the second lens. The lens effect is similar to part a) provided we substitute  $f_1$  with  $f_2$ . So we obtain a parameter  $q''' = -f_2 + i \frac{f_2^2}{z'_0}$ . that means that the waist position is at  $z = f_2$  after the lens and the new Rayleigh range is:  $z''_0 = \frac{f_2^2}{z'_0}$ .

3. Combining part a) and b) we find that  $z_0'' = \frac{f_2^2}{f_1^2} z_0$ . By substituting in the formula the definition of the Rayleigh range we obtain:

$$\begin{aligned}\frac{\pi W_0''^2}{\lambda} &= \frac{f_2^2}{f_1^2} \frac{\pi W_0^2}{\lambda} \\ W_0''^2 &= \frac{f_2^2}{f_1^2} W_0^2 \\ W_0'' &= \frac{f_2}{f_1} W_0\end{aligned}$$

### Problem 5 – Pulse propagation

3 + 3 + 2 = 8 points

- a) The propagation vector  $k(\omega)$  is defined as:

$$k(\omega) = \frac{\omega}{c_0} n(\omega)$$

Therefore, the phase and group velocities are:

$$\begin{aligned}v_p &= \frac{\omega}{k(\omega)} = \frac{c_0}{n(\omega_0)} = \frac{c_0}{2 + 4 \times 10^{-2}} \\ v_p &= \frac{c_0}{2.04} \\ v_g &= \left[ \frac{\partial k(\omega)}{\partial \omega} \Big|_{\omega_0} \right]^{-1} = \frac{c_0}{(B + 3C\omega^2) \Big|_{\omega_0}} = \frac{c_0}{2 + 0.12} \\ v_g &= \frac{c_0}{2.12}\end{aligned}$$

- b) We first calculate the dispersion coefficient

$$\begin{aligned}D &= \frac{\partial^2 k(\omega)}{\partial \omega^2} \Big|_{\omega_0} = \frac{6C\omega_0}{c_0} = 4 \times 10^{-25} \frac{\text{s}^2}{\text{m}} \\ T_0 &= 2/\omega_S = 2\text{ps} \\ z_0 &= -\frac{T_0^2}{2D} = -5\text{m}\end{aligned}$$

Therefore, the pulse width is given as:

$$\text{Width} = T(l) = T_0 \sqrt{1 + \left( \frac{l}{z_0} \right)^2} = \sqrt{17} T_0 \approx 8.246\text{ps}$$

- c) Since there is no dispersion in this medium, the group velocity is the same as the phase velocity. Therefore,

$$v_{p2} = \frac{c_0}{2}$$

and the time difference between the two is given as:

$$\Delta t = L \left| \frac{1}{v_{g1}} - \frac{1}{v_{g2}} \right| = \frac{20}{3 \times 10^8} |2.12 - 2| = 8\text{ns}$$

### Problem 6 – Fraunhofer diffraction

4 + 2 = 6 points

1. The *Fresnel approximation* is a paraxial approximation that is used for high Fresnel numbers which is normally associated with the near-field. The *Fraunhofer approximation* is a paraxial approximation that is valid for low Fresnel numbers ( $N_F \leq 0.1$ ) which is normally associated with the far-field.

2. The field in Fraunhofer approximation is proportional to the Fouriertransform of the initial field

$$u(x, z_B) \propto U_0 \left( \frac{kx}{z_B} \right).$$

$$\begin{aligned} U_0(\alpha) &\propto \int_{-\infty}^{\infty} u_0(x) e^{-i\alpha x} dx \\ &= \int_{-a/2}^{a/2} e^{-i\alpha x} dx \\ &= \frac{1}{-i\alpha} e^{-i\alpha a/2} - \frac{1}{-i\alpha} e^{i\alpha a/2} \\ &= \frac{\sin(\alpha a/2)}{\alpha/2} \\ &= a \operatorname{sinc}(\alpha a/2) \end{aligned}$$

So we get:

$$I(x, z_B) = |u(x, z_B)|^2 \propto \operatorname{sinc}^2 \left( \frac{kx}{2z_B} a \right)$$
