

Problem 1

Jinsong Liu 206216

(a)

$$\therefore W_p = \frac{\eta P_p}{h \nu_p A d (N_{tot} - n)}$$

$$\therefore P_p = h \nu_p A d (N_{tot} - n) \frac{W_p}{\eta}$$

$$P_{th} = h \nu_p A d (N_{tot} - N_{th}) \frac{W_{th}}{\eta}$$

$$W_{th} = \Gamma \frac{N_{th}}{N_{tot} - N_{th}}$$

$$\begin{aligned} \therefore P_{th} &= h \nu_p A d (N_{tot} - N_{th}) \cdot \frac{\Gamma N_{th}}{\eta} (N_{tot} - N_{th})^{-1} \\ &= h \nu_p A d \frac{\Gamma N_{th}}{\eta} \\ &= h \nu_s A d \frac{\Gamma N_{th}}{\eta \eta_{stokes}} \\ &= A d \frac{I_s \frac{1}{C I_R}}{\eta \eta_{stokes}} \\ &= 2 A d \frac{1}{C I_R} \frac{I_s \frac{I_R}{I_{ph}}}{2 \eta \eta_{stokes}} \end{aligned}$$

$$\because d/c = \frac{1}{2} I_R \quad I_R/I_{ph} = -\ln(1-L) - \ln(1-T)$$

$$\therefore P_{th} = \frac{-\ln[(1-L)(1-T)] A \cdot I_{sat}}{2 \eta \eta_{Stokes}}$$

$$P_{out} = \eta \cdot \frac{\eta_s}{\eta_p} \cdot T \cdot \left[-\ln[(1-L)(1-T)] \right]^{-1} \cdot (P_p - P_{th})$$

$$= \frac{\eta \cdot \eta_{Stokes} \cdot T}{-\ln[(1-L)(1-T)]} \cdot (P_p - P_{th})$$

$$\therefore \sigma_s = \frac{\eta \cdot \eta_{Stokes} \cdot T}{-\ln[(1-L)(1-T)]}$$

(b) $P_i = \sigma_s \cdot (P_p - P_{th})$

From the data sheet and linear regression calculation we can get:

$$T = 0.1 \quad P_i = 0.18 P_p - 2 \quad P_{th} = \frac{100}{9} \approx 11.11$$

$$T = 0.2 \quad P_i = 0.255 P_p - 4.25 \quad P_{th} = \frac{50}{3} \approx 16.67$$

$$T = 0.4 \quad P_i = 0.29 P_p - 7.8 \quad P_{th} \approx 26.90$$

$$P_{th} = \frac{-\ln[(1-L)(1-T)] \cdot A_{sat}}{2\eta\eta_{stokes}} = -\ln(1-T) \frac{A_{sat}}{2\eta\eta_{stokes}} - \ln(1-L) \frac{A_{sat}}{2\eta\eta_{bs}}$$

$$\text{let } y=0 \quad x = \frac{7.506}{38.303} = 0.196 = -\ln(1-L)$$

$$\therefore L \approx 0.178 = 17.8\%$$

Problem 2

Jinsong Liu 206216

(a)

$$P(\nu) \sim \frac{\left(\frac{2\delta\nu_R}{2}\right)^2}{(\nu - \nu_R)^2 + \left(\frac{2\delta\nu_R}{2}\right)^2}$$

$$\delta\nu_R = (4\pi Z_{ph})^{-1} \quad (\delta\nu_R \text{ is half-width})$$

(b) The power P is the intensity equal to that of the stimulated emission of all excited modes in the cavity. Only if the desired mode is separated from the large number of undesired ones, would the rather monochromatic radiation stand out clearly against the much wider frequency distribution of spontaneous emission.

$$(C) \quad \text{He-Ne:} \quad L_R = \frac{L}{\gamma C} \quad \delta\nu_R = 1/2\pi L R$$

$$L = 20 \text{ cm} \quad \gamma = -\ln R_2 \approx 0.01 \quad \lambda = 633 \text{ nm} \quad \nu_{z1} = 4.7 \times 10^{14} \text{ Hz}$$

$$L_R \approx \frac{20 \times 10^{-2}}{0.01 \times 3 \times 10^8} \approx 6 \times 10^{-8} \text{ s}$$

$$\delta\nu_R \approx 2.65 \times 10^6 \text{ Hz} \quad P = 1 \text{ mW}$$

$$\Delta\nu_{z1} = \frac{2\pi h \nu_{z1} (\delta\nu_R)^2}{P} = 0.01 \text{ Hz}$$

GaAs:

$$R = \left| \frac{n_1 - n_2}{n_1 + n_2} \right|^2 = \left(\frac{2.5}{4.5} \right)^2 \approx 0.3$$

$$\gamma = -\ln R \approx 1.2 \quad L = 300 \mu\text{m}$$

$$L_R = nL/\gamma C = \frac{3.5 \times 300 \times 10^{-6}}{1.2 \times 3 \times 10^8} = 2.92 \times 10^{-12} \text{ s}$$

$$\delta\nu_R = 5.5 \times 10^6 \text{ Hz} \quad \approx 2.92 \text{ ps}$$

$$\Delta\nu_{z1} = \frac{2\pi h \nu_{z1} (\delta\nu_R)^2}{P} = 4.3 \text{ MHz}$$

Problem 3

Jinsong Liu 20b216

(a)

$$\frac{dN_2}{dt} = W_{02} N_0 - S_{21} N_2$$

$$\frac{dN_1}{dt} = S_{21} N_2 + W_{01} N_0 - S_{10} N_1 - W_{10} N_1$$

$$\frac{dN_0}{dt} = -W_{02} N_0 - W_{01} N_0 + W_{10} N_1 + S_{10} N_1$$
